AI Overview

You can run a custom Python script in your VS Code ESP-IDF project by defining it in the `.vscode/tasks.json` file using the workspace Python environment.

Steps to Add the Script as a Task

1. **Place your script:** Save your Python script inside your project folder (for example, in a folder named `scripts/my_script.py` or directly in the root directory).
2. **Open `tasks.json`:** Navigate to `.vscode/tasks.json` in your project workspace. If the folder or file does not exist, create it inside `.vscode`.
3. **Configure the task:** Add a new task object to the `tasks` array. Use the ESP-IDF extension's Python interpreter or the standard workspace Python path.

Example `tasks.json` Configuration

json

```
{
    "version": "2.0.0",
    "tasks": [
        {
            "label": "Run Custom ESP-IDF Python Script",
            "type": "shell",
            "command": "${env:IDF_PYTHON_ENV_PATH}/bin/python",
            "args": [
                "${workspaceFolder}/scripts/my_script.py"
            ],
            "group": {
                "kind": "test",
                "isDefault": true
            },
            "problemMatcher": []
        }
    ]
}
```

Use code with caution.

(Note: On Windows, the python executable path in the virtual environment might be `${env:IDF_PYTHON_ENV_PATH}\\Scripts\\python.exe` instead).

How to Execute the Task

1. Open the Command Palette using `Ctrl+Shift+P` (Windows/Linux) or `Cmd+Shift+P` (macOS).
2. Type and select **Run Task**.
3. Choose **Run Custom ESP-IDF Python Script** from the list.

If you tell me your **operating system (Windows, macOS, or Linux)** and **where your script is located**, I can give you the **exact path settings** for your `tasks.json` file.
